

the 1990s, the number of people in the world who are undernourished has increased from 600 million to 800 million.

There are a number of reasons for this increase. One of the main reasons is that the world's population has grown by 1.5 billion in the last 20 years. This has put a huge strain on the world's food supply, and has led to a shortage of food in many parts of the world.

Another reason for the increase in undernourishment is that the world's food supply is not distributed evenly. In some parts of the world, there is a surplus of food, while in other parts, there is a shortage. This is due to a number of factors, including the way that food is produced and distributed, and the way that land is used.

One of the main reasons for the uneven distribution of food is that the world's food supply is not produced evenly.
